The use of LILAC in the management of renal cell carcinoma. Metastatic renal cell carcinoma (RCC) remains a major medical problem. In the last years new targeted drugs have been introduced for the treatment of metastatic RCC. However, prognosis remains dismal despite the developments in systemic therapy. Therefore, it is urgent to identify predictive biomarkers to personalize the treatment of patients with this disease. This review addresses the recent literature on the use of gene expression profiling for the identification of predictive biomarkers. Identification of genes involved in drug resistance and the identification of genetic signatures in RCC can provide valuable information in the development of future

treatment strategies./// Copyright (c) 2012

Q: How to prove this simple property of permutation group? For a permutation group G , how to prove if G contains $x, y, z \in G$ such that $xz = z$, $yz = x^{-1}$, then $xyz = x^{-1} = z$? This problem is from "Topics in the study of permutation groups", and I have no idea how to start. A: If you have x , y and z in G , then G is generated by xy and xz . If $xyz = x^{-1}$ and $z = xzyz$, then $xy = yzxyz$. If $xy = x^{-1}$, then $x = y^{-1}xy$ and

$y = x^{-1}xy^2$. So $xyz = z$. If $z = x^zy^z$ then $xy = x^{-1}$ and thus $xyz = xyx^z = x^{-1} = z$. A: If G contains x , y , and z with those properties, then G is generated by xy and xz , by the definition of a permutation group. If G is generated by x, y, z , then their order as a group must be three, so in that case, their order is three. From the fact that $xyz = x^{-1}$, we get that $xyx = y^zz$. But since xy generates G and xy generates G , if G is generated by x, y, z , then $G = xyx$. If G is generated by x, y, z , then $xz = z^{-1} = z$, so $G = xyz$. If x is not the identity, then we will have $\pi(xy) = (xy)\pi(x) = \pi(xy)\pi(x) = \pi(y^zz) = \pi(y)\pi(z)$, so $xyx = yz$. If z is not the identity, then we will have π
